User Acceptance Testing (UAT)

Date	22-10-2026
Team ID	
Project Name	i-Movies — Movie Ticket Booking System
Maximum Marks	As per evaluation

Project Overview:

Project Name: i-Movies — Movie Ticket Booking System

Description: A web application for discovering movies and booking cinema tickets, with movie/show information and booking-related features.

Project Version: 1.0 (submission build)

Testing Period: 22-10-2026

Testing Scope:

- API endpoint availability and response status
- Authentication and protected routes
- Movie listing/details and search endpoints
- Showtime and seat-selection flow
- Booking creation and booking retrieval
- Invalid request payloads and server-side validation
- Frontend/backend integration and CORS behavior

Requirements to be Tested:

- As a user, I want to access movie data through the API.
- As a user, I want protected operations to require valid authentication.
- As a user, I want booking requests to return clear success or error responses.
- As a developer, I want the frontend to communicate with the backend without CORS errors.

Testing Environment:

Frontend URL: https://i-movies-movie-ticket-booking-system-egeudkp2s.vercel.app/

Testing Tool: Postman (manual API testing)

Environment: Deployed frontend and configured backend API. Record the exact backend base URL used in Postman if required.

Test data: Use valid test records and non-sensitive test credentials; do not include real passwords or tokens in this report.

Test Cases:

Test Case ID	Test Scenario	Test Steps (Postman)	Expected Result	Recorded Result	Status
TC-001	Public movie API	GET the movie-list endpoint with no auth, if public.	HTTP 200 with a JSON response containing movie data.	Endpoint returned JSON response; confirm status and payload against current deployment.	PASS*
TC-002	Protected endpoint without token	Send request to a protected booking/profile endpoint without Authorization/cookie.	HTTP 401 or 403 with a clear authentication error.	Request rejected without valid authentication.	PASS*
TC-003	Invalid booking payload	POST booking endpoint with missing required fields or invalid IDs.	HTTP 400/422 and a validation message; no invalid booking created.	Validation/error response expected; verify response and database state during execution.	PENDING
TC-004	Valid booking request	POST booking endpoint with valid test user, show, and seat data.	Successful status (typically 200/201) and booking reference/details.	Requires valid test data and a confirmed available show/seat.	PENDING
TC-005	Movie search/filter	Send supported query parameters to movie-list/search endpoint.	HTTP 200 and results matching the supplied filter/search.	Confirm endpoint parameter names and response data in Postman.	PENDING
TC-006	CORS / frontend API integration	Inspect browser Network/Console while frontend calls backend; compare allowed origin and credentials settings.	Backend permits the exact frontend origin and credentials when cookies are used.	Potential issue to check: wildcard origin with credentials can cause browser CORS rejection.	CHECK
TC-007	Missing/expired token	Send a protected request with an invalid or expired token.	HTTP 401 and no protected data returned.	Confirm invalid-token handling in Postman.	PENDING
TC-008	Server error handling	Send malformed JSON or an unexpected value to a suitable API endpoint.	Clear 4xx validation response; no stack trace or secret details exposed.	Confirm response body and server logs during execution.	PENDING

**PASS indicates the expected behavior documented for the test scenario; verify the live response in Postman before treating it as an executed test result.*

Bug Tracking:

Bug ID	Bug Description	Steps to Reproduce	Severity	Status	Additional Feedback / Fix
BG-001	CORS rejection when credentials are used	1. Open frontend. 2. Trigger API request with credentials. 3. Inspect browser console.	High	To Verify	If origin is '*' while credentials are enabled, configure the exact deployed frontend origin and enable credentials.
BG-002	Protected API returns 401 unexpectedly	1. Sign in. 2. Call protected endpoint in Postman. 3. Check cookie/token is sent and parsed.	Medium	To Verify	Confirm auth cookie/token, expiry, credentials handling, and authorization middleware.
BG-003	Invalid payload may not return clear validation error	1. POST request with required field missing. 2. Inspect status and response body.	Medium	To Verify	Return 400/422 with a concise validation message; ensure no invalid record is saved.

Bug note: These are realistic example issues to investigate, not confirmed defects. Update severity and status after reproducing each issue in the current deployment.

Notes:

- API testing is performed through Postman by sending requests and inspecting status codes, response bodies, and headers.
- For browser CORS behavior, use the browser Network/Console alongside Postman; Postman itself does not enforce browser CORS policy.
- Capture screenshots of Postman requests/responses for evidence if required by the evaluator.
- Only mark a test as passed or a bug as confirmed after reproducing it on the current deployment.
