Project Design Phase
Problem – Solution Fit

Date	19/10/2026
Team ID	
Project Name	i-Movies — Movie Ticket Booking System
Maximum Marks	2 Marks

Problem – Solution Fit Overview:

The Problem–Solution Fit for i-Movies focuses on making movie discovery and ticket booking convenient by bringing movie information, showtimes, seat selection, and booking management into one web application.

Purpose:

- Help users find movies and relevant showtimes in one place.
- Allow users to view movie details and available theatres or screenings.
- Simplify seat selection and online ticket booking.
- Let users access their booking information and related account features.
- Provide administrative functions for maintaining movie, theatre, show, and booking information.

Problem Statement:

Moviegoers may need to search across different sources to compare movie details, showtimes, and seat availability. A fragmented process can make it harder to choose a suitable screening and complete a booking conveniently.

Solution:

i-Movies is a web-based movie ticket booking system that brings movie discovery and booking-related activities into one application.

- Movie listing and movie-detail browsing.
- Search, filtering, and sorting to help users find movies.
- Showtime and seat-selection workflow.
- Ticket booking and access to booking details, with cancellation where supported.
- User account and engagement features such as favourites, reviews, and ratings where available.
- Administrative management of movie, theatre, show, and booking information.

Note: This summary describes the intended problem–solution fit based on the project context; it does not claim formal user research or measured validation.
