Project Name	i-Movies — Movie Ticket Booking System
Maximum Marks	2 Marks

Proposed Solution for i-Movies

S. No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Moviegoers may need to search across different sources for movie details, theatre options, showtimes, and seat availability. This can make selecting a suitable screening and booking tickets less convenient.
2	Idea / Solution Description	i-Movies is a full-stack web application for discovering movies and booking cinema tickets. It brings movie information and the ticket-booking flow together, with administrative functionality for managing movie and show information.
3	Novelty / Uniqueness	• Movie browsing with search, filtering, and sorting. • Movie details and showtime discovery. • Seat selection and booking management. • User-facing features such as favourites, reviews, and ratings where implemented.
4	Social Impact / Customer Satisfaction	• Makes movie and show information easier to access in one place. • Helps users compare options before choosing a screening. • A simpler booking flow can reduce effort for moviegoers.
5	Business Model (Revenue Model)	The provided project information does not establish a revenue model. The current system is described as a movie ticket booking application; monetization is not claimed.
6	Scalability of the Solution	The application can be extended with additional movie/theatre data, improved search, more booking options, and further administrative capabilities as requirements grow.

Note: The solution description is based on the project context. Revenue model and future scalability items are not presented as implemented features.
